An application server is

a lava based server ver and requires a lava virtual machine (JVM) environment to run and support the enterprise applications that run on it. As part of configuring your application server, you can configure the Java SE Runtime Environment to tune performance and system resource usage. This topic applies to IBM virtual machines for Java.

Tuning the IBM ide virtual machine for Java

WebSphere Application Server provides tunable settings for its major components so that you can adjust the runtime environment to match the characteristics of your application. Applications can run successfully without changing the default values for these tuning

parameters. Other ver applications might need changes, for example, a larger heap size, to achieve optimal performance.
